INDIA METEOROLOGICAL DEPARTMENT

WMO Regional Climate Center

WMO Regional Climate Centers (RCCs) are centres of excellence that create regional products that support regional and national climate activities, and thereby strengthen the capacity of WMO Members in a given region to deliver up-to-date climate information and prediction products for climate services.

16-Oct-19

What are WMO RCOs

WMO Regional Climate Centres (RCCs) are centres of excellence that provide climate services including forecasts, advisories and reports to member states and other stakeholders. WMO Member States are committed to ensure their climate services are of the highest quality.

Forecast

CFS Forecasts
Climate Forecast Service for Asia and South Asia

About RCC

Regional Climate Centre (RCC) Pune with its expertise in the use of modern technology (weather radar) will be able to provide better climate services to member states.

Key priority RCC Functions

WMO RCCs provide the following set of services to member states including the delivery of long range forecasting (LRF) services, monitoring, data services and training.

Historical Services

CFS (India)
CFS Historical Services for India and South Asia

Expanded Range Forecast

Extended Range Forecast

WMO Regional Climate Center

MANDATORY FUNCTIONS of RCC

- Operational Activities for Long Range Forecast (LRF)
- Operational Activities for Climate Monitoring
- Operational Data Services, to support operational LRF and climate monitoring
- Training in the use of operational RCC products and services

There are 3 WMO Designated RCC in RAI Region

Beijing Climate Center (BCC)

Tokyo Climate Center (TCC)

Regional Climate Center IMD, Pune

South Asian Climate Outlook Forum (SASCOF): Background

- ❖ In Asia, China has been coordinating a RCOF called 'Forum on Regional Climate Monitoring, Assessment and Prediction for Regional Association II (FOCRA II)' since 2005, covering the entire Asian continent.
- ❖ Asia is a large continent with large differences in the climatological settings on a sub-regional scale. Therefore WMO's Regional Association II (Asia) recommended sub-regional RCOFs devoted to specific needs of groups of countries having similar climatic characteristics.
- ❖ Implementation of South Asian Climate Outlook Forum (SASCOF) in 2010 is a step in that direction with specific focus on the climate information needs of nations affected by the Asian summer monsoon climate.

SASCOF Training workshops

Associated with SASCOFs forum meetings, Training workshops on seasonal prediction are also conducted. IMD designs and conducts the training workshops as per the regional requirement. Support of international experts is also used. The participating climate experts from the NMHS of the region are trained in using, interpreting and downscaling global seasonal prediction products and developing a consensus outlook.

Basic of Seasonal Forecast

16-Oct-19

भारत मौसम विज्ञान विभाग
INDIA METEOROLOGICAL DEPARTMENT

Scales of processes/models

Global

- Long waves
- El Nino
- Monsoons

Synoptic

- Jet streams
- High and low pressure centers
- Troughs and Ridges
- Fronts

Meso

- Thunderstorms
- Convective complexes
- Tropical storms
- Land/sea breezes
- Mountain/valley breezes
- Downslope wind storms
- Gap flows
- Cold air damming
- Nocturnal low-level jets
- Lake-effect snow bands

Urban

- Street-canyon flows
- Channeling around buildings, wakes
- Vertical transport on upwind and warm faces of buildings
- Flow in subway tunnels

Weather vs. Climate Forecasts

Weather Forecast

Run NWP model for a period up to two weeks (synoptic timescale)

Objective: Forecast relatively precise weather conditions at a specific time and place

Example: NWP model suggests it will likely rain tomorrow afternoon because mid-latitude cyclone will occur over the U.S.

Climate Forecast

Run NWP model for a period longer than two weeks.

Objective: Forecast probability of deviation from average conditions, or climatology.

Example: In the fall before an El Niño winter, a NWP model forced with warm sea surface temperatures in eastern tropical Pacific projects a circulation pattern favorable for above-average winter precipitation in Arizona.

NOT DESIGNED TO PREDICT EXACT WEATHER FOR SPECIFIC PLACES/TIMES MONTHS IN ADVANCE.

CLIMATE FORECASTS

WEATHER FORECASTS

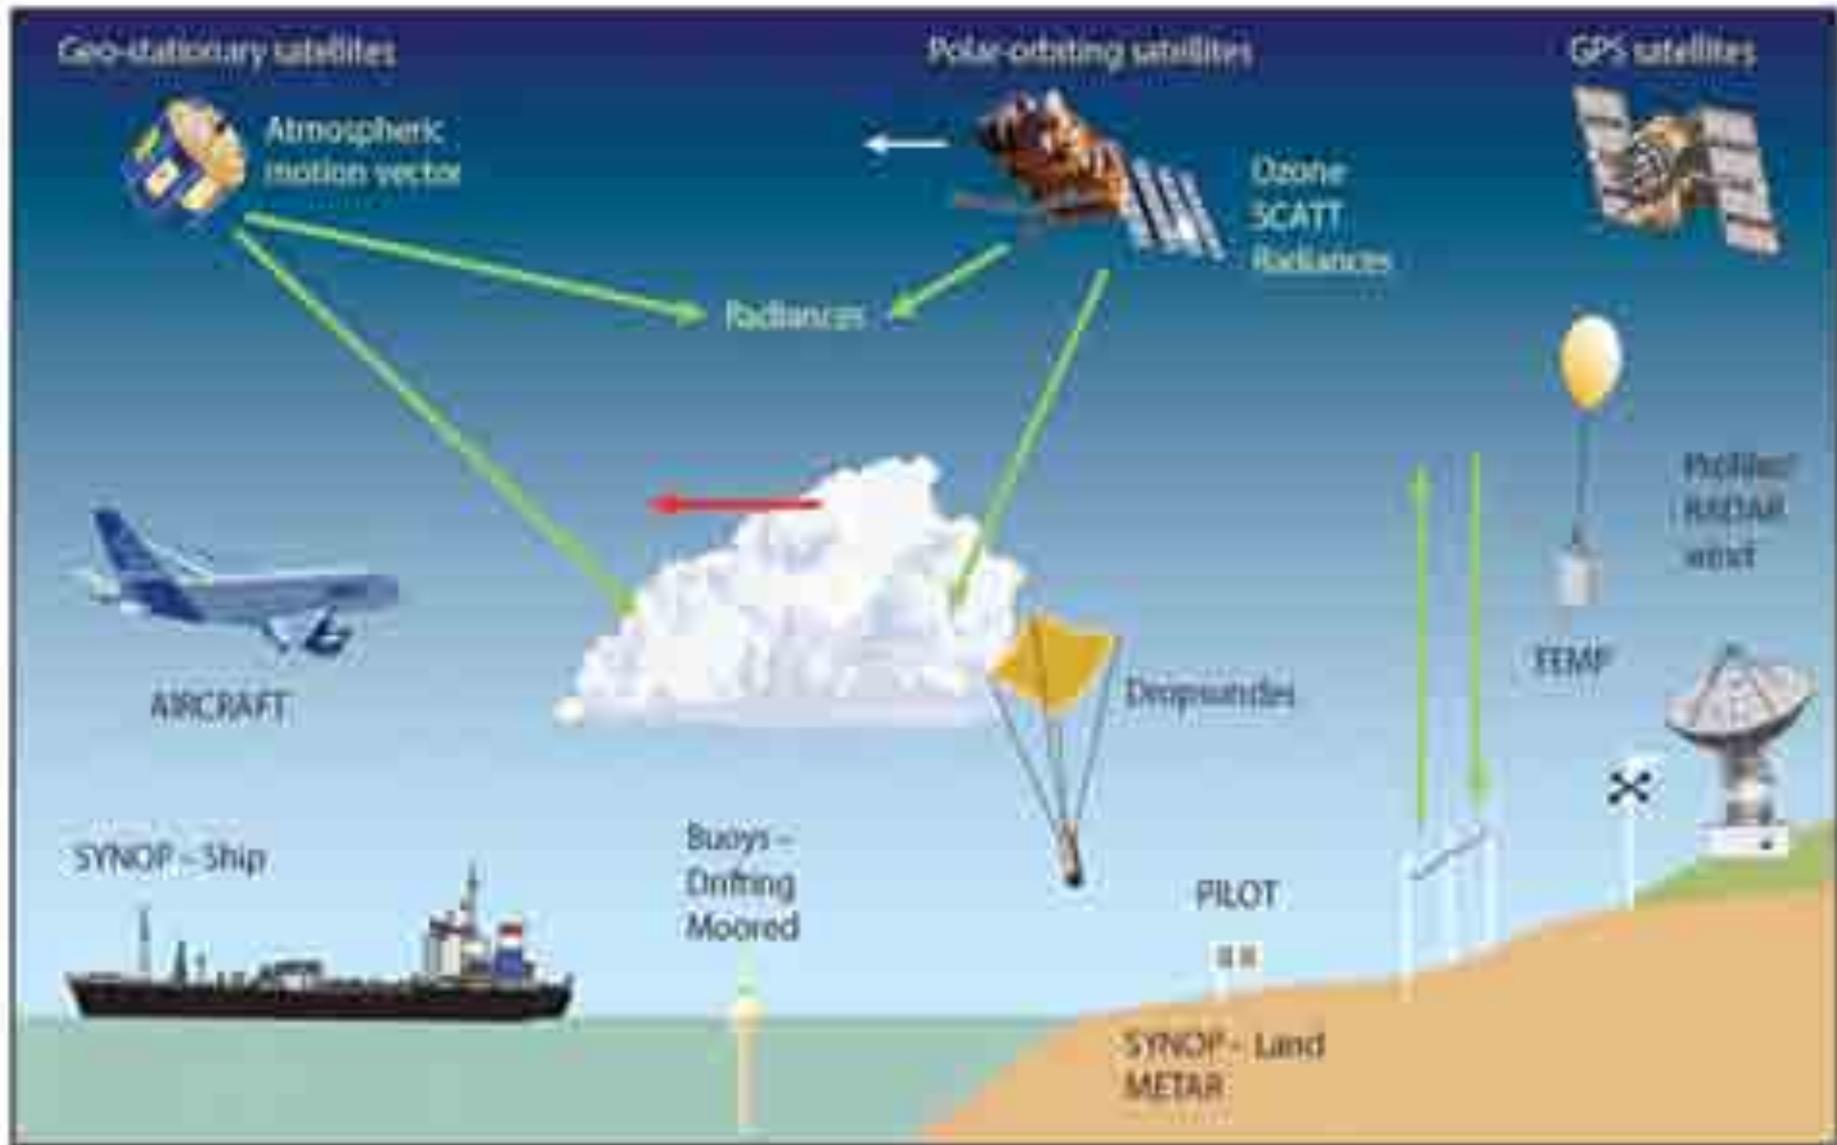

Extended & Seasonal Prediction

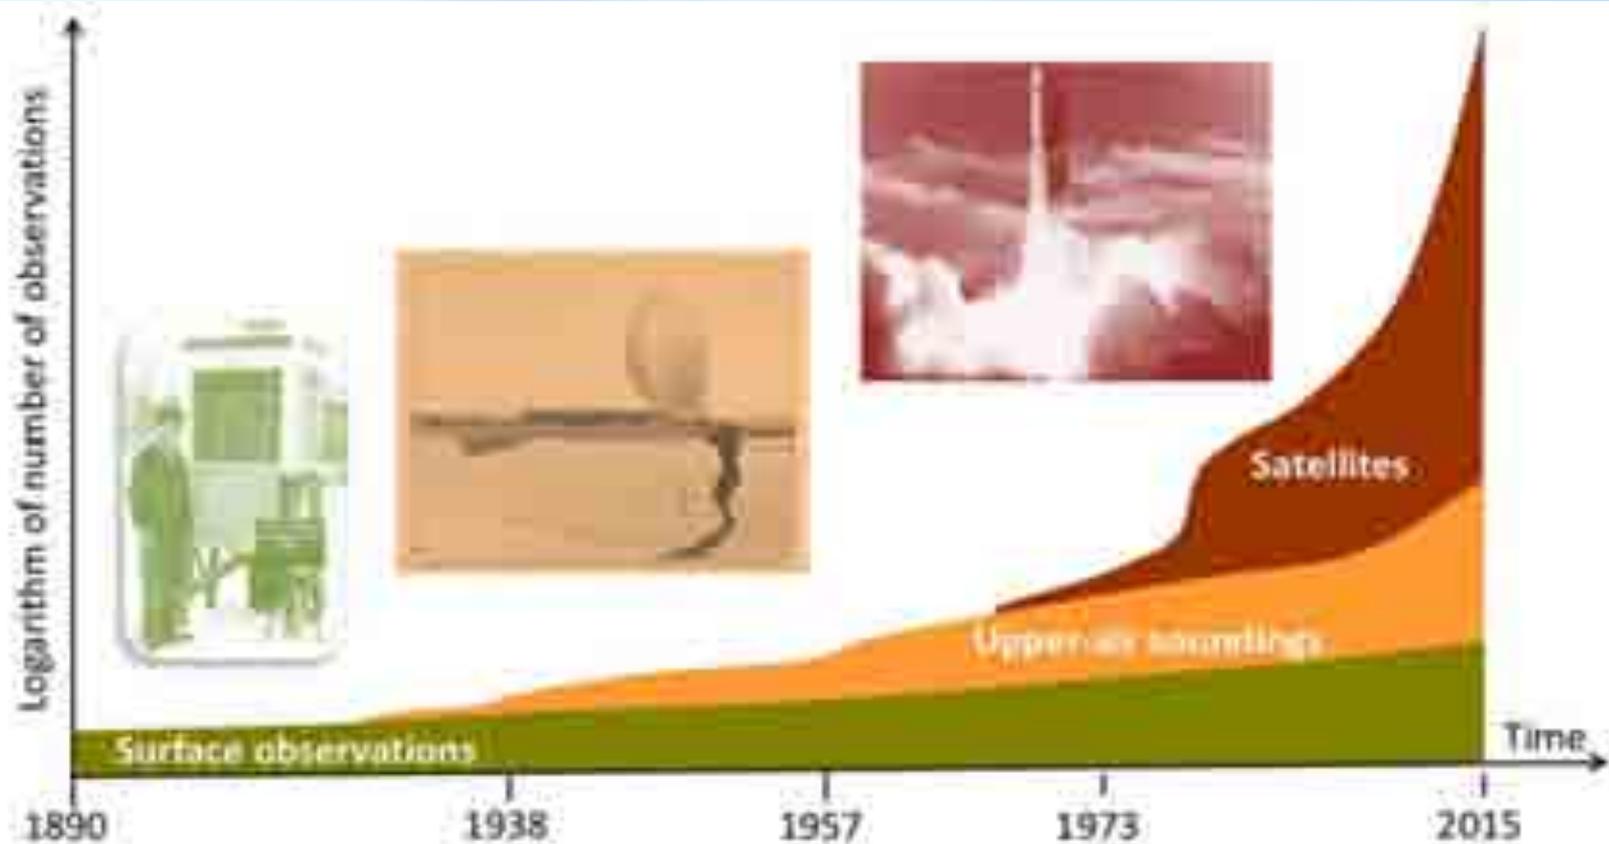

- ❖ Though the day to day changes in weather cannot be predicted for a period beyond 1-2 weeks, it has been suggested that climate variations (climate being defined as the space-time average of weather) can be predicted if averaged over certain space and time scales.
- ❖ How well we can predict it or if we can predict them at all depends upon our ability to understand and model the mechanisms causing the climate variations.

ENSO & IOD: Status and Forecast

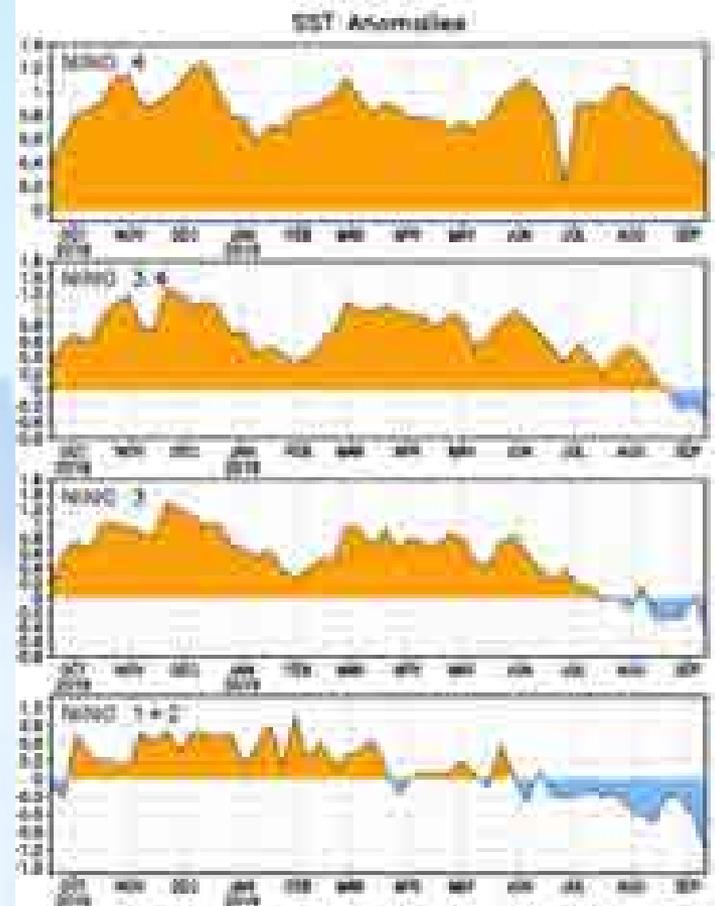

Latest Global SST Departures (°C) and ENSO Conditions over Pacific

Average SST Anomalies
18 AUG 2019 – 14 SEP 2019

Recent evolution of NINO SSTs

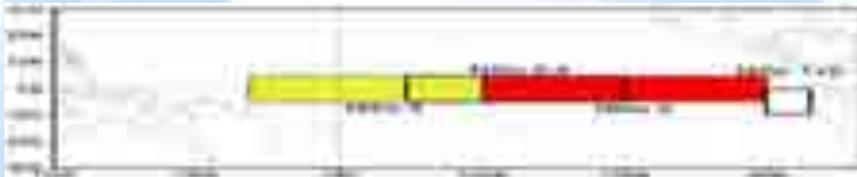

Data source
CPC, USA

The latest weekly SST departures are:

Data source
CPC, USA

Niño 4	0.3°C
Niño 3.4	-0.3°C
Niño 3	-0.5°C
Niño 1+2	-1.3°C

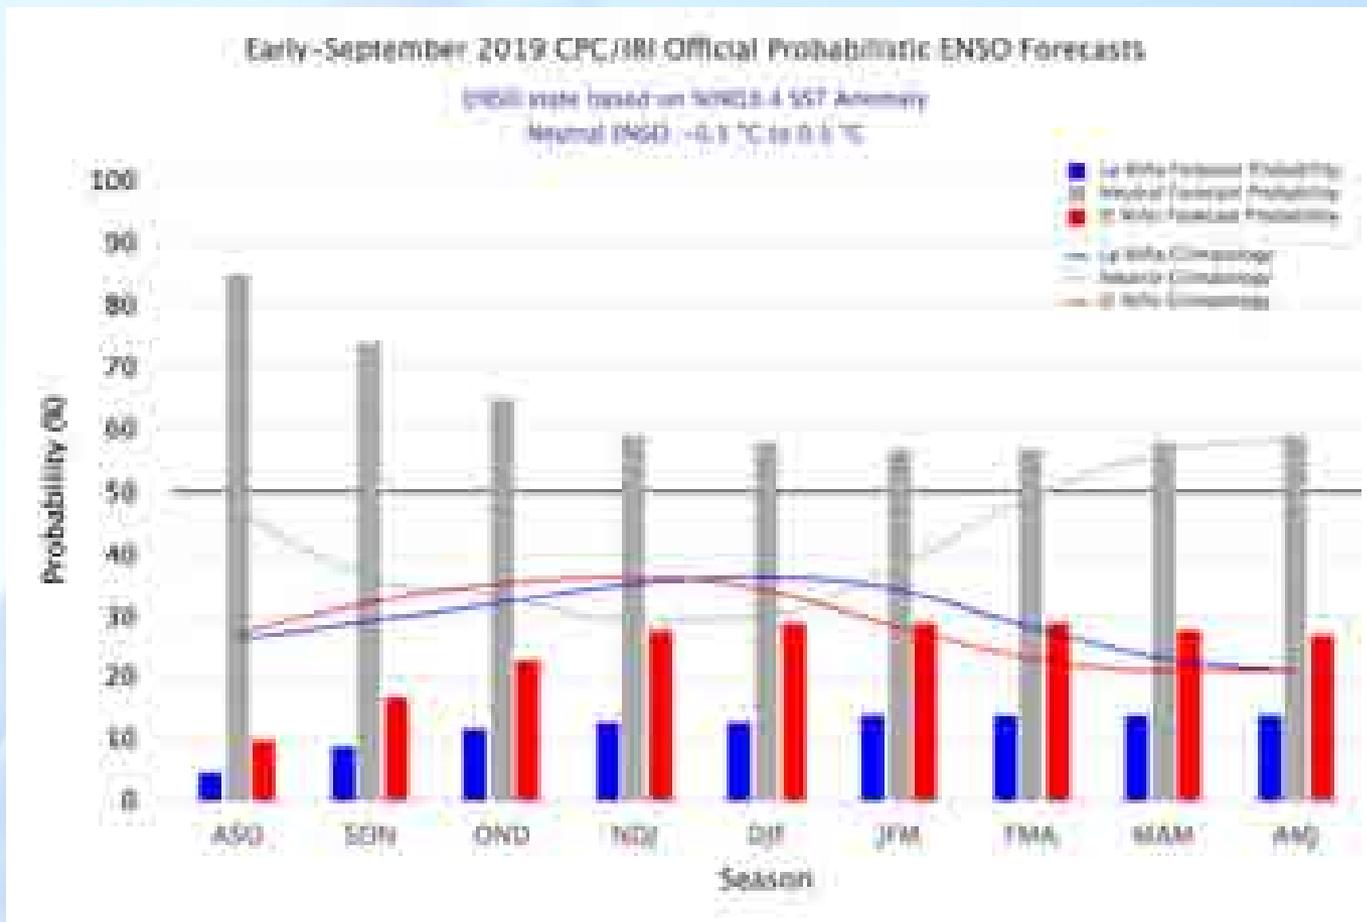

During the last four weeks, equatorial SSTs were above average across the western Pacific Ocean and also the central Indian Ocean. SSTs were below average near Indonesia and in the east-central and eastern Pacific and central Atlantic

Latest ENSO Forecast (September 2019)

IRI, USA

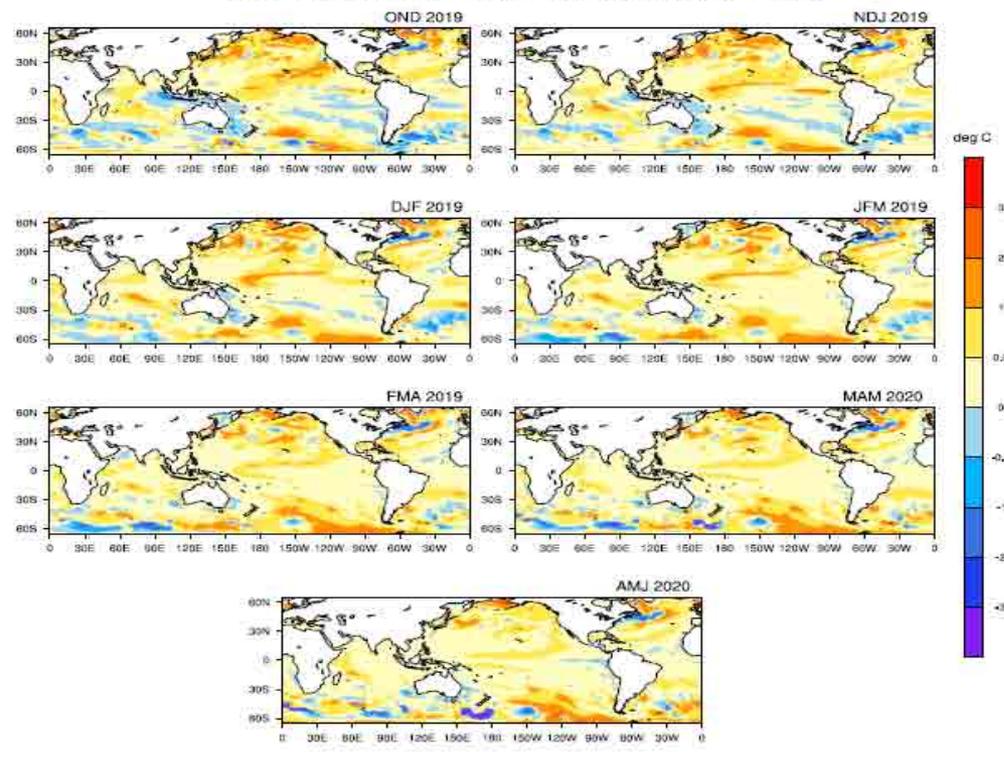

ENSO-neutral is most likely to continue through the Northern Hemisphere spring 2020.

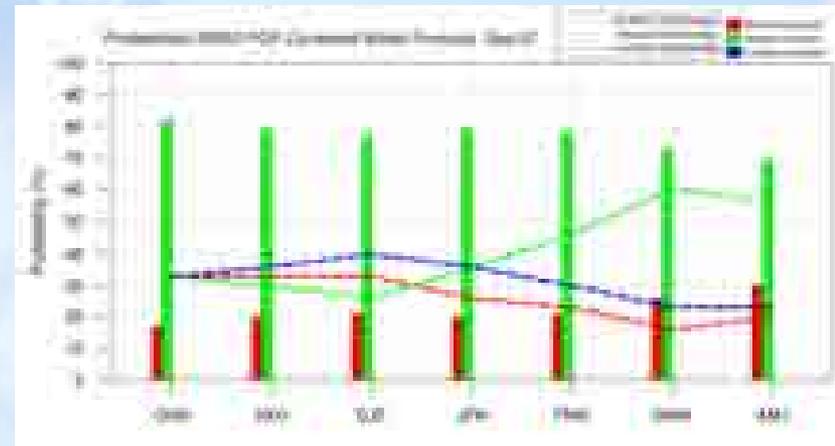

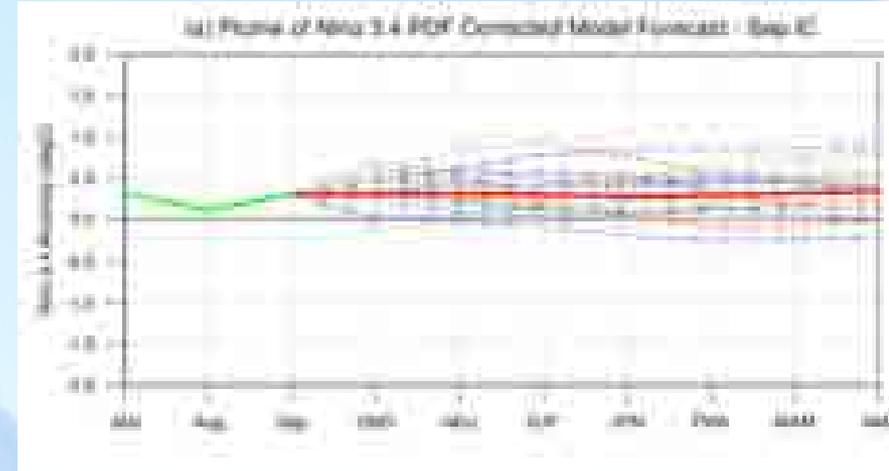

ENSO Forecast - MMCFS: September IC

MMCFS SST Anomaly Forecast : Sep 2019 IC

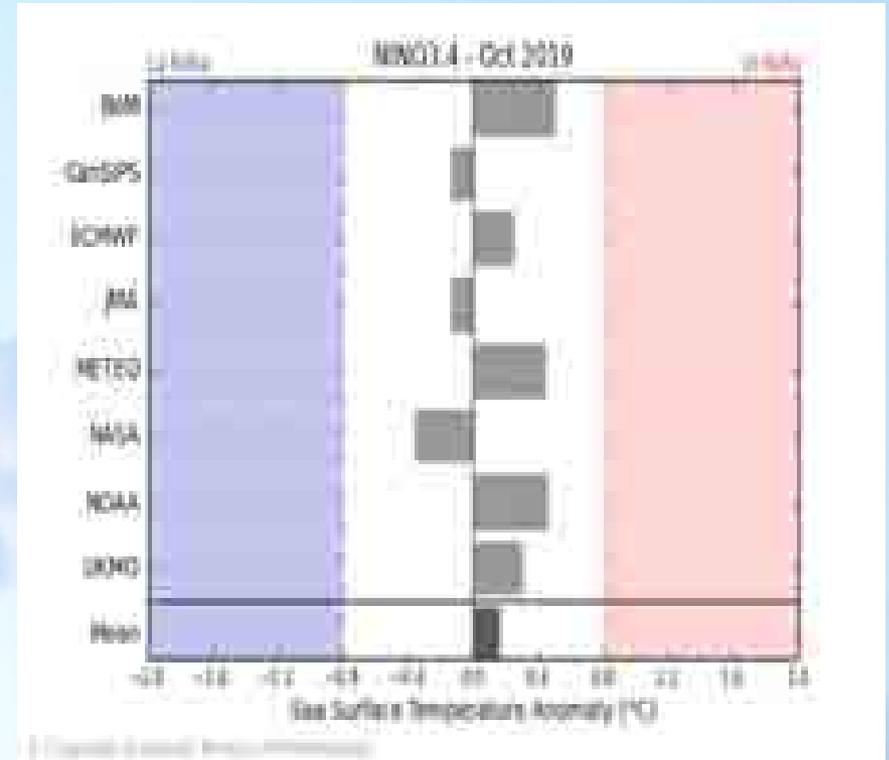

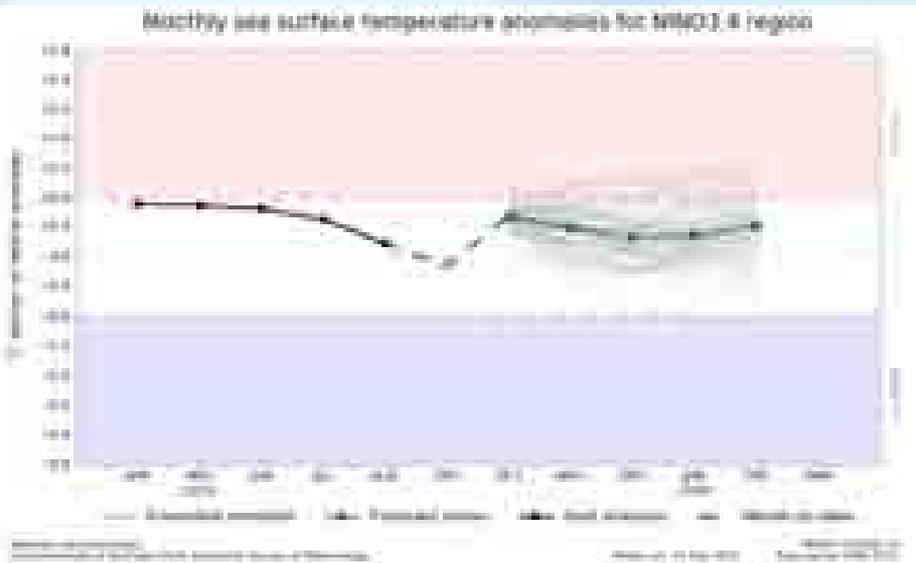

Plume of Nino 3.4 PDF Corrected Model Forecast – Sep IC

In September, Negative anomaly observed over the NINO3.4 region. Latest MMCFS forecast indicate continuation of the ENSO neutral conditions during NE monsoon season.

BoM, Australia: ENSO Forecast

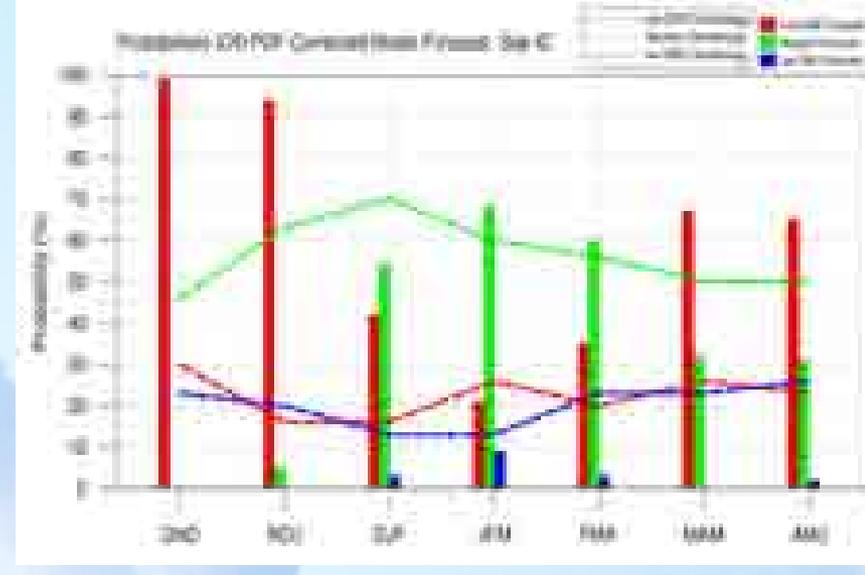

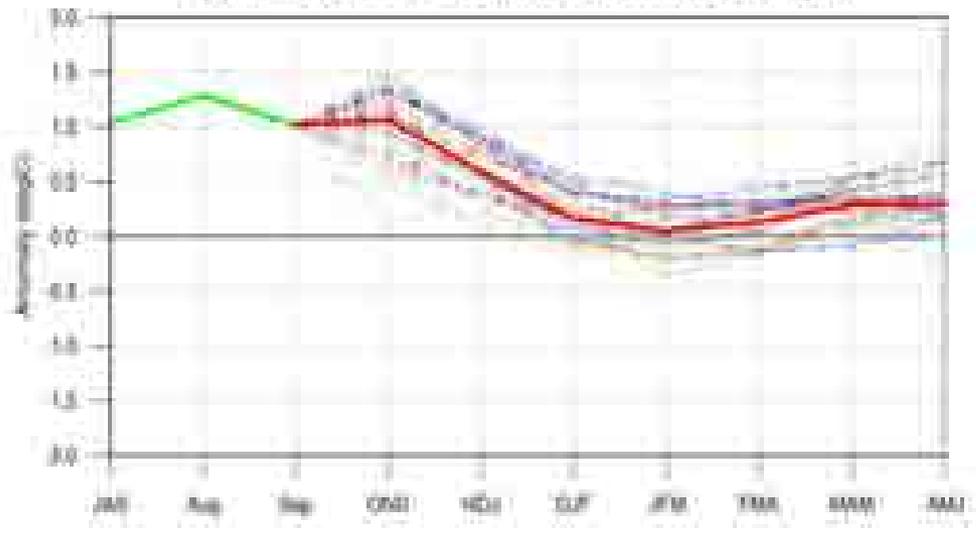

Pacific Ocean will continue to be in ENSO Neutral conditions in the coming months.

IOD Forecast - MMCFS: September IC

(b) Plume of IOD PDF Corrected Model Forecast - Sep IC

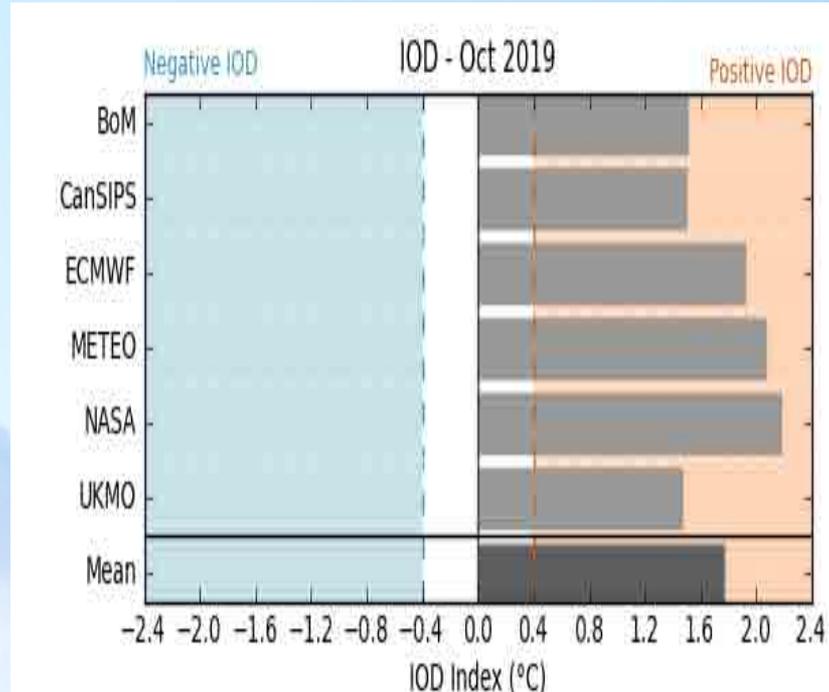

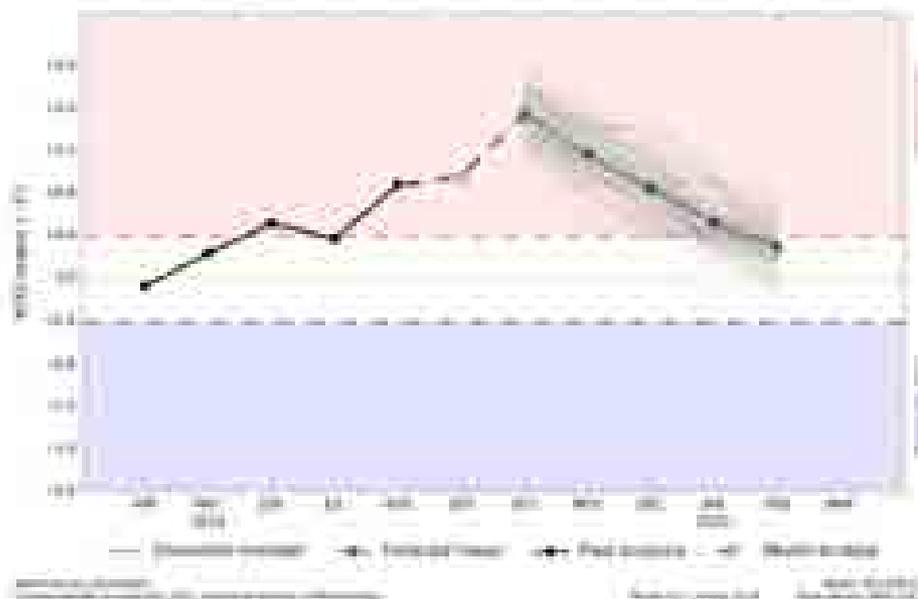

The positive IOD conditions are likely to continue

SASCOF Consensus statements

The image shows a screenshot of a web page for the South Asian Climate Outlook Forum (SASCOF-2). The page features a navigation bar at the top with links for 'Home', 'About Meeting', 'About Process', 'Download Report', 'Media/Photo', and 'Contact Us'. On the left side, there is a sidebar with a search bar and several menu items: 'Seasonal Climate Outlook for South Asia', 'Month: Feb 2011', 'Year: 2011', 'SASCOF Forum', 'Climate Diagnostic Bulletin', 'Annual Climate Summary', and 'Consensus Statement'. The main content area displays three logos at the top: the India Meteorological Department logo, the World Meteorological Organization logo, and a stylized globe logo. Below the logos, the text reads: 'South Asian Climate Outlook Forum (SASCOF-2)', 'Pune, India, 13-15 April 2011', and 'Consensus Statement'. Under the heading 'Summary', the text states: 'A consensus outlook for the 2011 southwest monsoon rainfall over South Asia was developed, through an expert assessment of the available indications. The outlook, based on the various prevailing global climate conditions and forecasts from different empirical and dynamical climate models, indicates large'.

Flash Flood Guidance System

- ❖ **Flash Flood Guidance System for South Asia**
- ❖ **Soil & Water Assessment Tool (SWAT) model indigenously customised in collaboration with IIT Delhi**
- ❖ **Variable Infiltration Capacity Model developed by IIT Gandhinagar**
- ❖ **Real-time Interactive MeTEYE : Indigenously developed GIS Visualisation of all model products into one platform for effective interpretation on dynamic time scales.**

Flash Flood Guidance System

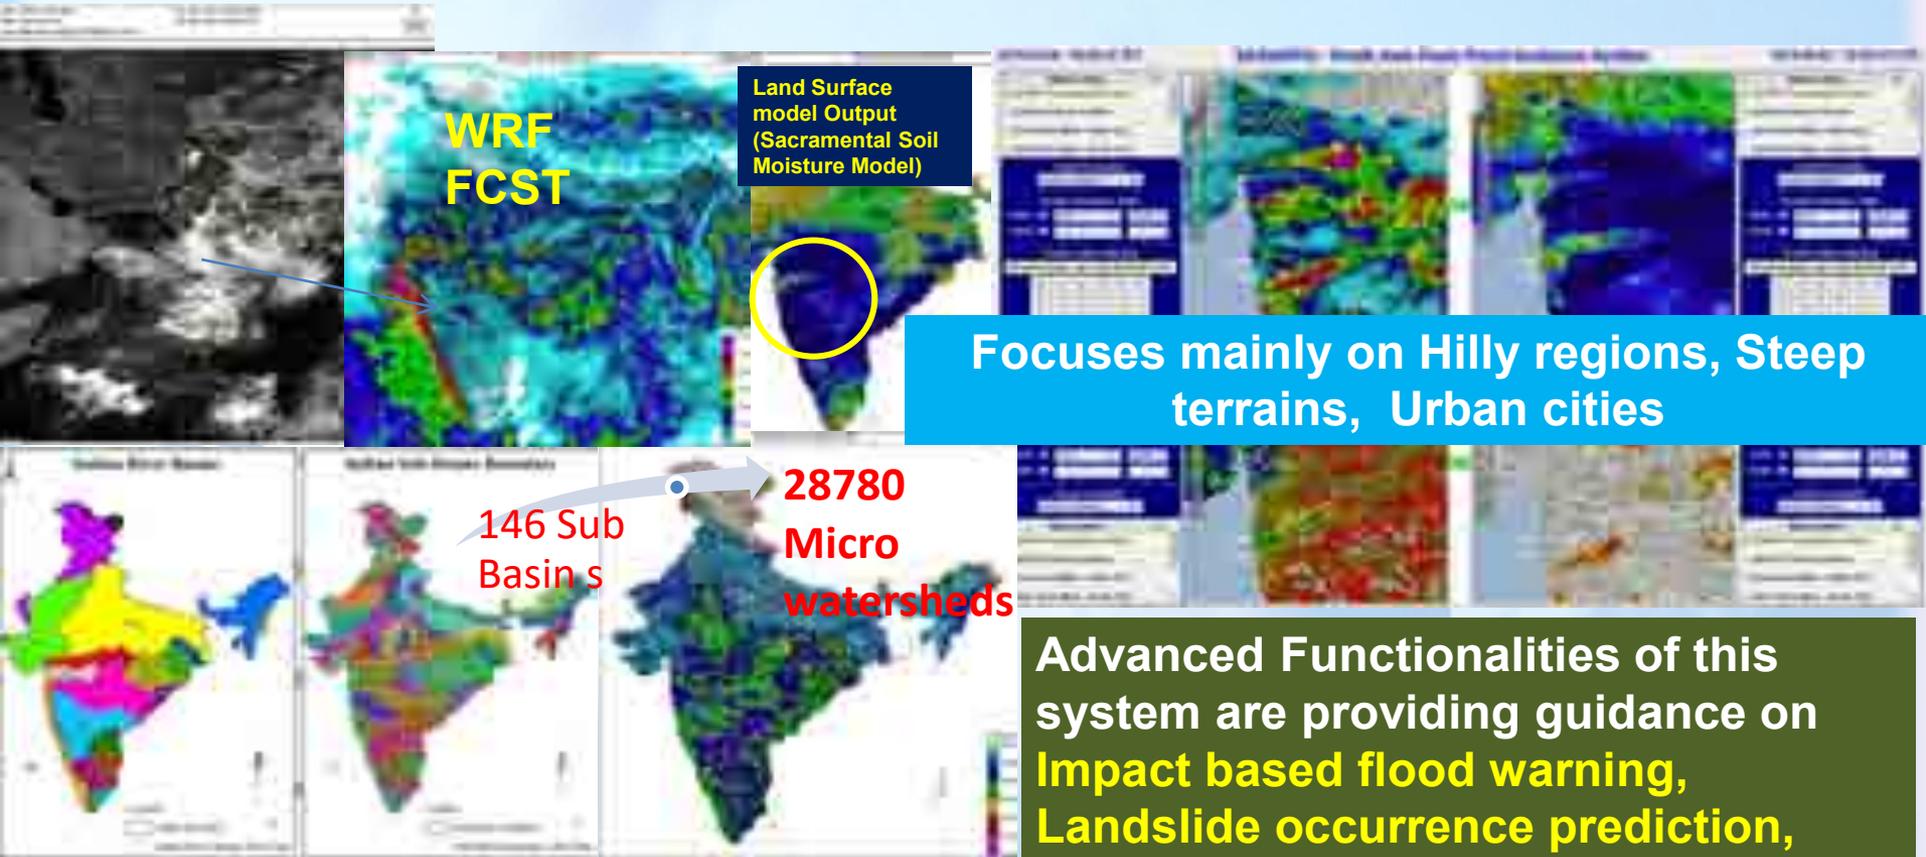

- ❖ Globally accepted model and at operational over 64 countries.
- ❖ Unlike a predictive system, It is a diagnostic system to provide real-time informational guidance pertaining to potential small scale flash flooding throughout the region of application.
- ❖ It uses Sacramento Soil Moisture LS model to produce Average Soil Moisture (mm) which estimates upper zone water tension upto 30 cms.
- ❖ The model runs every 6 hours with continuous satellite inputs every hour.
- ❖ Use of Radar Data to be incorporated to provide guidance at selected urban cities.
- ❖ Few Case studies over our region being validated for submission to research publishing soon.
- ❖ Presently the system is live and active at IMD Server, likely to be operationalized this May 2019 with a press release.

A Flash Flood Guidance System caters flash flood guidance at sub catchment scale over the entire South Asian region

WMO recognised IMD as a Regional Leader in catering services to Nepal, Bhutan, Bangladesh, Sri Lanka

Visualises multiple outputs/ forecasts of the micro level catchment areas at the same time which identifies flash flood prone zones to be operational this Monsoon 2019

SOUTH ASIA FLASH FLOOD GUIDANCE FORECASTER CONSOLE

Username:

Password:

Effective warning messages are short, concise, understandable, and actionable, answering the questions: "what?", "where?", "when?", "why?", and "how to respond?"

FORECASTER'S TOOL

Please, fill in all required fields with your data and send effective flash flood warning for users and emergency managers to take appropriate actions to mitigate loss of life, property and commerce.

Any delay in the issuance of a warning can result in catastrophic losses!

Single access to be provided to each RMC's.

Hands on Training to be imparted for selected participants for

Alerts, Warnings, Guidance bulletin with

International access already executed and IMD keeps a watch to provide necessary guidance to member countries timely via email, CAP (if available)

SWAT is an evaluating tool of soil & water developed by USDA Agricultural Research Service (Neitsch et al., 2002)

A river basin scale model SWAT (Soil & Water Assessment Tool) customized to predict the impact of land management practices in large, complex watersheds.

It is a distributed model operates in continuous daily time step at basin scale : modified as per Indian Conditions.

In Collaboration with IIT Delhi

Flood Forecast for River Basins based on IMD Rainfall Forecast

VIC Model – Inputs & Forcing Data

Provides sub grid variability of elevation, soil, and vegetation (Gao et al. 2010).

Vegetation parameters extracted from the Advanced Very High-Resolution Radiometer (AVHRR) global 1km spatial resolution land cover information.(Sheffield and Wood 2007; Hansen et al. 2000).

Utilizes Harmonized World Soil Database version 1.2 (HWSD) soil data to develop **soil parameters** run in VIC model at sub-continental river basins. Sources of Vegetation library and elevation bands taken from Gao et al. (2010).

Observed data precipitation (0.25 degree) while temperature (0.5 degree), further regrided into 0.25 degree Tmax & Tmin using high-resolution digital elevation model (30 m) (for lapse rate) and the SYMAP algorithm as described in Maurer, et al. (2002).

Observed Wind data from NCEP/NCAR.

Forecasted precipitation, temperature, and wind data from IMD GFS at **0.125 degrees** for 10 forecast days at 3-hour temporal resolution, further regrided to 0.25 degree.

Forecasted precipitation, temperature, and wind data from ERFs at **1 degree** for 32 forecast days at 1-day temporal resolution, further regrided to 0.25 degree to make it consistent with the observed data.

Global Forecast System (GFS)

3 hourly, ~12 km, 10 days forecast

Regridded to 0.25°

Runs once in a day

- High temporal resolution
- High spatial coverage

Extended Range Forecast System (ERFS)

Daily, 1 degree, 32 days forecast

Regridded to 0.25°

Runs once in a week

- Accuracy
- Extended range forecast data

Forecast products

- Precipitation (mm)
- Max. temperature (°C)
- Min. temperature (°C)
- Wind (m/s)

Courtesy: Dr. D.R. Patnaik et al, Dr. V.R. Durai et al & NWP team
